

04. Mongoose Schema & Model Creation

Step 1: Defining Mongoose Schema

A **Schema** defines the shape of documents, data types, defaults, and validation rules:

```
models/user.js - Schema Definition

const mongoose = require("mongoose");

const userSchema = new mongoose.Schema({
  name: String,
  email: String,
  age: Number,
  isActive: { type: Boolean, default: true }
});
```

Step 2: Creating Model Constructor

A **Model** is a constructor class used to instantiate and query documents from the database:

```
models/user.js - Model Creation

// mongoose.model(modelName, schema)
const User = mongoose.model("User", userSchema);
module.exports = User;
```

Creating & Saving Documents (.save())

```
index.js - Save Document

// 1. In-memory JS instance (not yet persisted to DB)
const user1 = new User({
  name: "Amit Sharma",
  email: "amit@gmail.com",
  age: 21
});

// 2. .save() is asynchronous and persists document to MongoDB
user1.save()
  .then((res) => console.log("Saved to DB:", res))
  .catch((err) => console.log(err));
```

Direct Bulk Insert: Model.insertMany()

User.insertMany([...]) directly persists multiple documents into MongoDB without requiring separate `.save()` calls!

Pluralization Magic & Operation Buffering

Behind The Scenes Magic: Collection Pluralization

When you provide model name **"User"**, Mongoose automatically **lowercases** and **pluralizes** it to create the collection:

"User" → **"users"** | **"Product"** → **"products"** | **"Person"** → **"people"**

Mongoose uses the *pluralize* library internally, ensuring irregular English plurals (such as Person → people) are accurately converted.

Operation Buffering (Interview Favorite Concept!)

What is Operation Buffering? If establishing your MongoDB connection takes 2 seconds, you can still immediately invoke `User.find()` or `user.save()` without errors!

```

index.js - Operation Buffering Example

// Query invoked BEFORE connection finishes:
User.find().then((data) => console.log("Data fetched:", data));

// Connect is called later:
mongoose.connect("mongodb://127.0.0.1:27017/collegeDB");
// Mongoose queues the query in memory and executes it once connected!
  
```

TOPPER TIP: If you want a custom collection name without pluralization, pass a 3rd argument: `mongoose.model("User", userSchema, "custom_users")`!
